

How to Change any text on the Website

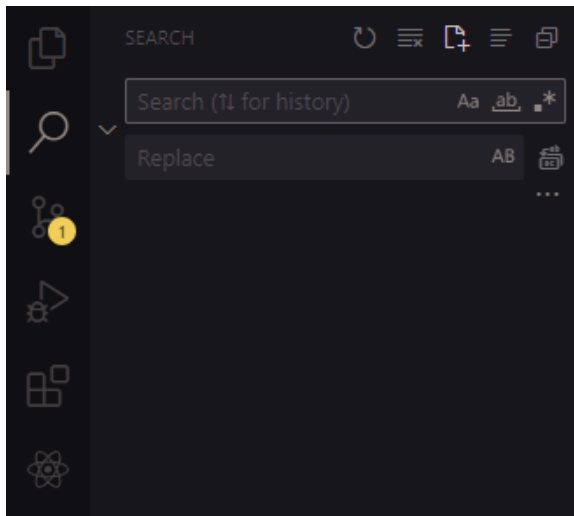

This is a general guide on how to go through and change ANY visible text you see on the webpage, please look for what text you wanna change by locally viewing your webpage first. For a basic example I will be showing how to change the name of the models beside the pictures for template-1.

Once on the local webpage, take a note of ANY text you want to change. In my case I want to change the text “Model 1” that is seen next to the first model at the top of the page.

From here go to VScode, where your local webpage should be running from and click on the search icon on the left hand side of the window:

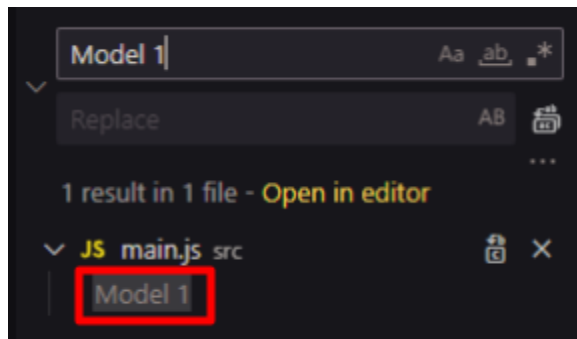

Once here, the right side of your window should look like this:

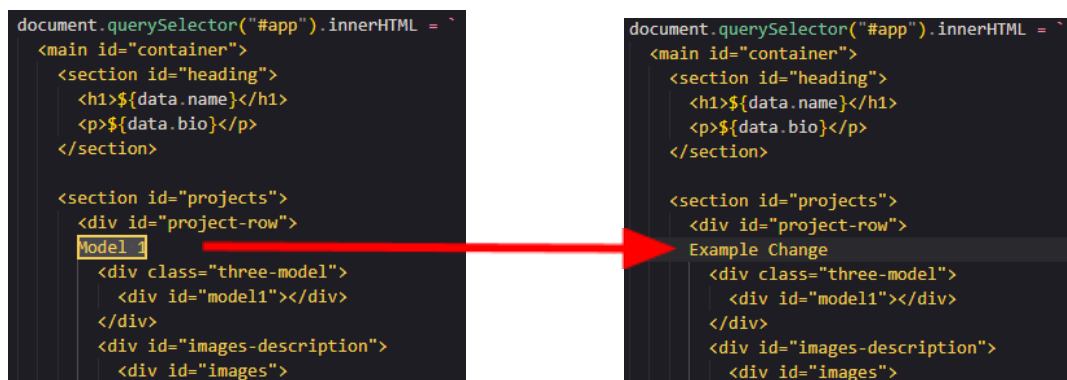

Here in the search bar type whatever piece of text you would like to see changed on your local webpage. In my case, I am going to type in “Model 1”.

This should show you where in the code that text actually is (shown in the picture below), from here click on the text that matches your search to go to the exact location of where that text comes from. NOTE: For some pieces of text there might be multiple locations where that text is coming from, click any of them, change them, and see exactly what changes on your current local webpage to see what it corresponds to (you have to do “ctrl+s” after every change to update the webpage). If it is something you didn’t want to change just do “ctrl+z” to undo and save again to revert the change.

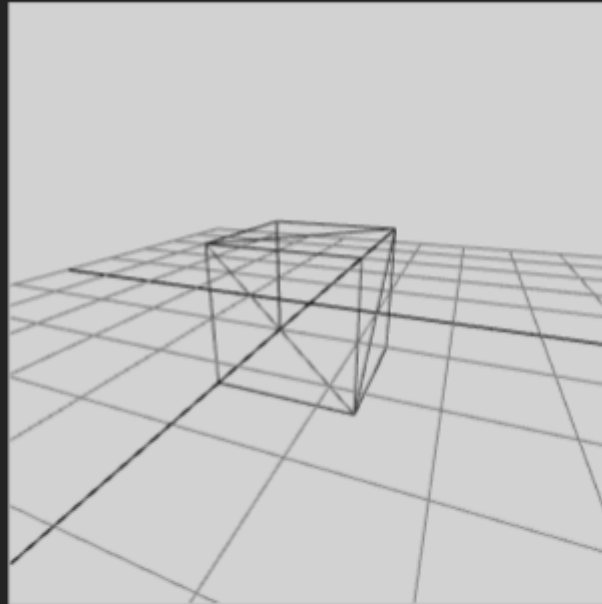

Once you are at the exact location of the text, just delete it, and change it to whatever you like (obviously within reason). DO NOT CHANGE ANYTHING OTHER THAN THE TEXT, if you do just do “ctrl+z” to undo any changes. From here I just change “Model 1” to “Example Change”.

This will update the webpage as so:

Model 1

Example Change
